IMMUNIZATION REQUIREMENTS

New York State law and Farmingdale State College, in keeping with recommendations of the American College Health Association and the Centers for Disease Control, require all students born on or after January 1, 1957 who are attending an institution of higher education to show proof of two doses of live measles vaccine, one dose of live mumps vaccine and one dose of live rubella vaccine, given after one year of age. In lieu of immunization dates, the physician may provide a date of disease for measles and mumps only; history of rubella disease is not acceptable. Student may also choose to have blood tests called titers in lieu of immunizations which will show actual levels of immunity to each of the three diseases. If titers are drawn, please attach copies of actual laboratory reports.

ALL NURSING, DENTAL HYGIENI	E AND MEDICAL LABORATOR	₹Y TECHNOLOGY STUDENTS
MUST SUBMIT THE FOLLOWING TITE	RS, WHICH ARE REQUIRED F	FOR THEIR CLINICAL ROTATIONS:

Hepatitis B (or proof of shots)

Measles

Mumps

Rubella

Varicella

Please use grid below to enter information. Please attach copies of laboratory reports for all titers.

About Meningococcal Disease

What is meningococcal disease?

Meningococcal disease is caused by bacteria called Neisseria meningitis. It can lead to serious blood infections. When the linings of the brain and spinal cord become inflamed, it is called meningitis. The disease strikes quickly and can have serious complications, including death.

Anyone can get meningococcal disease. Some people are at higher risk. This disease occurs more often in people who are:

- Teenagers or young adults.
- Infants younger than one year of age.
- Living in crowded settings, such as college dormitories or military barracks
- Traveling to areas outside of the United States, such as the "Meningitis belt" in Africa.
- Living with a damaged spleen or no spleen.
- Being treated with Soliris[®], or who have complement component deficiency (an inherited immune disorder).
- Exposed during an outbreak.
- Working with meningococcal bacteria in a laboratory.

What are the symptoms?

Symptoms appear suddenly - usually three to four days after a person is infected. It can take up to 10 days to develop symptoms. Symptoms may include:

- A sudden high fever
- Headache
- Stiff neck (meningitis)
- Nausea and vomiting
- Red-purple skin rash
- Weakness and feeling very ill
- Eyes sensitive to light

How is meningococcal disease spread?

It spreads from person-to-person by coughing or coming into close or lengthy contact with someone who is sick or who carries the bacteria. Contact includes kissing, sharing drinks, or living together. Up to one in 10 people carry meningococcal bacteria in their nose or throat without getting sick.

Is there treatment?

Early diagnosis of meningococcal disease is very important. If it is caught early, meningococcal disease can be treated with antibiotics. But, sometimes the infection has caused too much damage for antibiotics to prevent death or serious long-term problems. Most people need to be cared for in a hospital due to serious, life-threatening infections.

What are the complications?

Ten to 15 percent of those who get meningococcal disease die. Among survivors, as many as one in five will have permanent disabilities. Complications include:

- Hearing loss
- Brain damage
- Kidney damage
- Limb amputations
